# MVC :- Model View Control
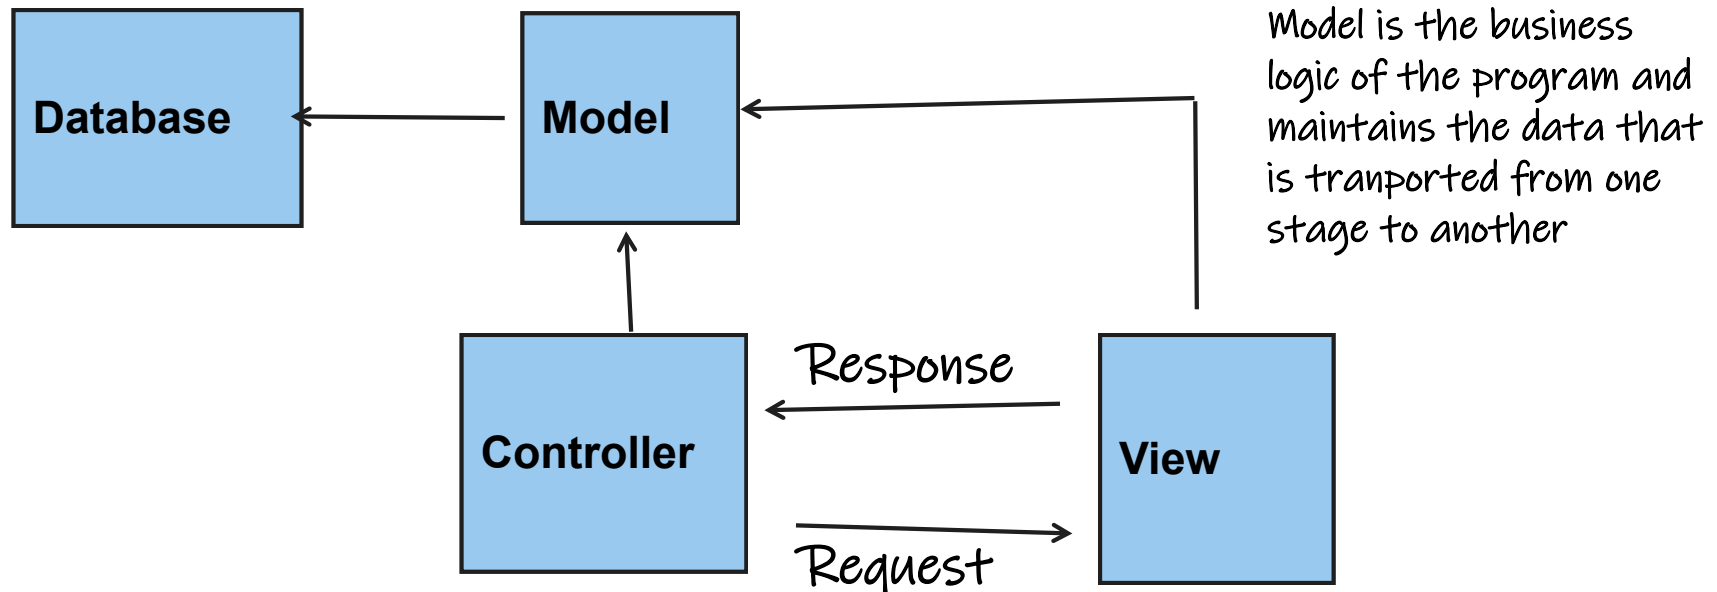

Model View Controller is an architectural pattern that seperates the application into three main logical components

| Database | | Model |
|---|---|---|

Model is the business logic of the program and maintains the data that is tranported from one stage to another

| Controller | Response | View |
|---|---|---|

Request

Controller consists of public methods or actions which handle the incoming HTTP requests.

Mostly group the similar types of actions together

View is used for all the user interface logic of the particular program and everytime user chooses to log in, the view page is displayed

Most of the code will be consisted of HTML, CSS, JS, XML and other front end code that are required for designing user interfaces for webpages
